

PRODUCT

WATER HARVESTING SYSTEMS**PURPOSE**

Clearmake water harvesting systems treat harvested rain or storm water to a standard suitable for reuse. These systems minimise the use of potable or town water supplies while also protecting the environment from contaminants that might otherwise be discharged.

APPLICATIONS

Applications include all forms of water harvesting for reuse. Examples include:

- Harvesting water from roof or hardstand areas for use in manufacturing or wash down applications
- Harvesting water for toilet flushing or irrigation
- Harvesting water for use in mining and civil works
- Harvesting water for non potable supplies such as fountains, swimming pools and public facilities

**SPECIFICATIONS****Design and Manufacture**

Clearmake water harvesting systems are custom designed and manufactured in Australia to suit your particular contaminants and treated water requirements, ensuring the most cost effective and efficient solution for your application. The small to medium systems are skid mounted and pre commissioned in our factory to minimise installation time and ensure product quality testing is done prior to installation.

Treatment Rates

Systems can treat a wide range of flow rates from 30 l per hour through to more than 100,000 l per hour.

Control System

All systems can be fully automated to minimise operator involvement and ensure reliable high quality results. Systems can also be designed and manufactured to comply with the intrinsically safe requirements of hazardous areas.
